Assignment 1

Student Code: 1079860

March 2023

Question assigned to the following page: [1](#)

Question 1

Since A is symmetric, there exists an orthogonal matrix P ($\implies P^T = P^{-1}$) which diagonalises A such that

$$\begin{aligned} P^T A P &= D \\ \implies P P^T A P &= P D \\ \implies A P &= P D \\ \implies A P P^T &= P D P^T \\ \implies A &= P D P^T \\ \implies A^2 &= P D P^T P D P^T = P D D P^T = P D^2 P^T \end{aligned}$$

D is a diagonal matrix with A 's eigenvalues of 0s and 1s on its diagonal. Therefore D^2 can be represented like so

$$D^2 = \begin{bmatrix} I & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} I & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} I & 0 \\ 0 & 0 \end{bmatrix} = D$$

$$\begin{aligned} \implies D^2 &= D \\ \implies P D^2 P^T &= P D P^T \\ \implies A^2 &= A \implies A \text{ is idempotent} \end{aligned}$$

Questions assigned to the following page: [2.1](#) and [2.2](#)

Question 2

$$A = A^2, \quad B = B^2, \quad A + B = (A + B)^2$$

(a)

$$\begin{aligned} A + B &= (A + B)^2 = A^2 + AB + BA + B^2 \\ \implies A &= A^2 + AB + BA + B^2 - B \\ \implies A &= A^2 + AB + BA + B - B \\ \implies A - A^2 &= AB + BA \\ \implies A - A &= AB + BA \\ \implies AB + BA &= 0 \end{aligned}$$

(b)

$$A = PDP^T, \quad B = P\Lambda P^T$$

so from (a) we have

$$\begin{aligned} PDP^T P\Lambda P^T + P\Lambda P^T PDP^T &= 0 \\ \implies PD\Lambda P^T + P\Lambda DP^T &= 0 \\ \implies PD\Lambda P^T &= -P\Lambda DP^T \\ \implies D\Lambda &= -\Lambda D \\ \implies \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} \Lambda_{11} & \Lambda_{12} \\ \Lambda_{21} & \Lambda_{22} \end{bmatrix} &= \begin{bmatrix} -\Lambda_{11} & -\Lambda_{12} \\ -\Lambda_{21} & -\Lambda_{22} \end{bmatrix} \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix} \\ \implies \begin{bmatrix} I_r \Lambda_{11} + 0 & I_r \Lambda_{12} + 0 \\ 0 & 0 \end{bmatrix} &= \begin{bmatrix} -\Lambda_{11} I_r + 0 & 0 \\ -\Lambda_{21} I_r + 0 & 0 \end{bmatrix} \\ \implies \begin{bmatrix} \Lambda_{11} & \Lambda_{12} \\ 0 & 0 \end{bmatrix} &= \begin{bmatrix} -\Lambda_{11} & 0 \\ -\Lambda_{21} & 0 \end{bmatrix} \end{aligned}$$

Therefore we have

$$\begin{aligned} \Lambda_{11} &= -\Lambda_{11} \implies \Lambda_{11} = 0 \\ \Lambda_{12} &= 0 \\ -\Lambda_{21} &= 0 \implies \Lambda_{21} = 0 \end{aligned}$$

Question assigned to the following page: [2.3](#)

(c)

$$\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} \Lambda_{11} & \Lambda_{12} \\ \Lambda_{21} & \Lambda_{22} \end{bmatrix} = \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & \Lambda_{22} \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & \Lambda_{22} \end{bmatrix} \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$$

$$\implies 0 = D\Lambda = \Lambda D$$

$$\implies 0 = D\Lambda P^T = \Lambda D P^T$$

$$\implies 0 = PD\Lambda P^T = P\Lambda D P^T$$

$$\implies 0 = PD P^T P \Lambda P^T = P \Lambda P^T P D P^T$$

from (b) $A = PD P^T$ and $B = P \Lambda P^T$

$$\implies AB = BA = 0$$

Question assigned to the following page: [3](#)

Question 3

$$\begin{aligned} \text{var } A\vec{y} &= E[(A\vec{y} - A\vec{\mu})(A\vec{y} - A\vec{\mu})^T] \\ &= E[A(\vec{y} - \vec{\mu})(\vec{y} - \vec{\mu})^T A^T] \\ &= A E[(\vec{y} - \vec{\mu})(\vec{y} - \vec{\mu})^T] A^T \\ &= A (\text{var } \vec{y}) A^T \\ \implies \text{var } A\vec{y} &= A (\text{var } \vec{y}) A^T \end{aligned}$$

Question assigned to the following page: [4.1](#)

Question 4

(a)

$$\begin{aligned} |V - \lambda I| &= 0 \\ (1 - \lambda) \begin{vmatrix} 1 - \lambda & -1 \\ -1 & 1 - \lambda \end{vmatrix} &= 0 \implies (1 - \lambda)((1 - \lambda)^2 - 1) = 0 \\ \implies (1 - \lambda)(1 - 2\lambda + \lambda^2 - 1) &= 0 \implies (1 - \lambda)(\lambda^2 - 2\lambda) = 0 \end{aligned}$$

so we have

$$1 - \lambda = 0 \implies \lambda = 1$$

or

$$\lambda^2 - 2\lambda = 0 \implies \lambda(\lambda - 2) = 0 \implies \lambda = 0, 2$$

$$(V - \lambda I)\vec{x} = 0$$

for $\lambda = 0$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$x_1 = 0$$

$$x_2 - x_3 = 0 \implies x_2 = x_3$$

$$\implies \vec{x} = t \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

where $t \in \mathbb{R} \setminus \{0\}$

for $\lambda = 1$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$-x_2 = 0$$

$$-x_3 = 0$$

$$\implies x_1 \neq 0 \text{ as } \vec{x} \neq 0$$

Questions assigned to the following page: [4.1](#) and [4.2](#)

$$\implies \vec{x} = t \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

where $t \in \mathbb{R} \setminus \{0\}$

for $\lambda = 2$

$$\begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & -1 \\ 0 & -1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$-x_1 = 0$$

$$-x_2 - x_3 = 0 \implies -x_2 = x_3$$

$$\implies \vec{x} = t \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$$

where $t \in \mathbb{R} \setminus \{0\}$

(b)

$$z_1 = 3y_1 + 2y_2 + y_3$$

$$= \begin{bmatrix} 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ y_3 \end{bmatrix} = A\vec{y} \text{ where } A = \begin{bmatrix} 3 & 2 & 1 \end{bmatrix}$$

$$\implies z_1 \sim MVN(A\vec{\mu}, AVA^T)$$

$$A\vec{\mu} = \begin{bmatrix} 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 4 \end{bmatrix} = 3 + 4 + 4 = 11$$

[R code for calculating AVA^T]

```
A = matrix(c(3,2,1), 1, 3)
V = matrix(c(1, 0, 0, 0, 1, -1, 0, -1, 1), 3, 3)
varZ1 = A %*% V %*% t(A)
> varZ1 = 10
```

$$\implies AVA^T = 10$$

$$\implies z_1 \sim MVN(11, 10)$$

$$\implies z_1 \sim N(11, 10)$$

Question assigned to the following page: [4.3](#)

(c)

$$\begin{aligned} z_2 &= y_1^2 + \left(\frac{y_2+y_3}{2}\right)^2 + \left(\frac{y_2-y_3}{2}\right)^2 \\ &= y_1^2 + \frac{1}{4}y_2^2 + \frac{1}{2}y_2y_3 + \frac{1}{4}y_3^2 + \frac{1}{4}y_2^2 - \frac{1}{2}y_2y_3 + \frac{1}{4}y_3^2 \\ &= y_1^2 + \frac{1}{2}y_2^2 + \frac{1}{2}y_3^2 \end{aligned}$$

$$\implies z_2 = \vec{y}^T B \vec{y} \text{ where } B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \frac{1}{2} & 0 \\ 0 & 0 & \frac{1}{2} \end{bmatrix}$$

$$BV = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \frac{1}{2} & 0 \\ 0 & 0 & \frac{1}{2} \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & -1 & 1 \end{bmatrix}$$

[R code for calculating BV]

```
B = matrix(c(1, 0, 0, 0, 1/2, 0, 0, 0, 0, 1/2), 3, 3)
V = matrix(c(1, 0, 0, 0, 1, -1, 0, -1, 1), 3, 3)
B %*% V
(B %*% V) %*% (B %*% V)
```

$$BV = (BV)^2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \frac{1}{2} & -\frac{1}{2} \\ 0 & -\frac{1}{2} & \frac{1}{2} \end{bmatrix}$$

$\implies BV$ is idempotent and $\text{rank}(BV) = \text{tr}(BV) = 2$ as BV is idempotent and symmetric
 \implies By Theorem 3.8, $z_2 \sim \chi_{2, \frac{11}{2}}^2$ with $\frac{11}{2} = \frac{1}{2} \vec{\mu}^T B \vec{\mu} = \lambda$

[R code for calculating λ]

```
B = matrix(c(1, 0, 0, 0, 1/2, 0, 0, 0, 0, 1/2), 3, 3)
muVec = matrix(c(1, 2, 4), 3, 1)
ncp = 1/2 * t(muVec) %*% B %*% muVec
```

Questions assigned to the following page: [5.1](#), [5.2](#), and [5.3](#)

Question 5

(a)

$$\vec{y} = X\vec{\beta} + \vec{\epsilon}$$

$$\begin{bmatrix} 85 \\ 97 \\ 76 \\ 79 \\ 76 \\ 99 \\ 49 \\ 72 \\ 83 \end{bmatrix} = \begin{bmatrix} 1 & 86 \\ 1 & 85 \\ 1 & 89 \\ 1 & 82 \\ 1 & 84 \\ 1 & 86 \\ 1 & 84 \\ 1 & 78 \\ 1 & 92 \end{bmatrix} \begin{bmatrix} \beta_0 \\ \beta_1 \end{bmatrix} + \begin{bmatrix} \epsilon_1 \\ \epsilon_2 \\ \epsilon_3 \\ \epsilon_4 \\ \epsilon_5 \\ \epsilon_6 \\ \epsilon_7 \\ \epsilon_8 \\ \epsilon_9 \end{bmatrix}$$

(b)

$$\vec{b} = (X^T X)^{-1} X^T \vec{y}$$

[R code for calculating \vec{b}]

```
y = c(85,97,76,79,76,99,49,72,83)
X = matrix(c(rep(1,9),86,85,89,82,84,86,84,78,92), 9, 2)
b = solve(t(X) %*% X, t(X) %*% y)
```

$$\vec{b} = \begin{bmatrix} -3.245 \\ 0.973 \end{bmatrix}$$

(c)

$$s^2 = \frac{(\vec{y} - X\vec{b})^T (\vec{y} - X\vec{b})}{n - (k+1)}$$

[R code for calculating s^2]

```
y = c(85,97,76,79,76,99,49,72,83)
X = matrix(c(rep(1,9),86,85,89,82,84,86,84,78,92), 9, 2)
b = solve(t(X) %*% X, t(X) %*% y)
e = y - X %*% b
SSRes = sum(e^2)
s2 = SSRes / (length(y) - length(b))
> s2 = 231.447
```

$$s^2 = 231.447$$

Question assigned to the following page: [5.4](#)

(d)

$$z_i = \frac{e_i}{\sqrt{s^2(1-H_{ii})}}$$

[R code for calculating \vec{z}]

```
y = c(85,97,76,79,76,99,49,72,83)
X = matrix(c(rep(1,9),86,85,89,82,84,86,84,78,92), 9, 2)
b = solve(t(X) %*% X, t(X) %*% y)
e = y-X %*% b
SSRes = sum(e^2)
s2 = SSRes/(length(y)-length(b))
H = X %*% solve(t(X) %*% X) %*% t(X)
z = e / sqrt(sampleVar*(1-diag(H)))
```

$$\vec{z} = \begin{bmatrix} 0.320 \\ 1.224 \\ -0.550 \\ 0.180 \\ -0.173 \\ 1.300 \\ -2.066 \\ -0.060 \\ -0.298 \end{bmatrix}$$

Questions assigned to the following page: [5.5](#) and [5.6](#)

(e)

$$D_i = \frac{1}{k+1} z_i^2 \left(\frac{H_{ii}}{1-H_{ii}} \right)$$

[R code for calculating \vec{D}]

```
y = c(85,97,76,79,76,99,49,72,83)
X = matrix(c(rep(1,9),86,85,89,82,84,86,84,78,92), 9, 2)
b = solve(t(X) %*% X, t(X) %*% y)
e = y-X %*% b
SSRes = sum(e^2)
s2 = SSRes/(length(y)-length(b))
H = X %*% solve(t(X) %*% X) %*% t(X)
z = e / sqrt(sampleVar*(1-diag(H)))
cooksDist = (1/length(b))*(z^2)*(diag(H)/(1-diag(H)))
```

$$\vec{D} = \begin{bmatrix} 0.007 \\ 0.094 \\ 0.045 \\ 0.004 \\ 0.002 \\ 0.112 \\ 0.293 \\ 0.002 \\ 0.042 \end{bmatrix}$$

(f)

Let \hat{y} = the point estimate for $x_1 = 90$

$$\text{Then } \hat{y} = \vec{t}^T \vec{b}$$

$$\text{where } \vec{t} = \begin{bmatrix} 1 \\ 90 \end{bmatrix} \text{ and } \vec{b} = \begin{bmatrix} -3.245 \\ 0.973 \end{bmatrix}$$

[R code for calculating \hat{y}]

```
y = c(85,97,76,79,76,99,49,72,83)
X = matrix(c(rep(1,9),86,85,89,82,84,86,84,78,92), 9, 2)
b = solve(t(X) %*% X, t(X) %*% y)
> c(1,90) %*% b = 84.312
```

$$\hat{y} = 84.312$$
